ADVANCED SECURE VOTING SYSTEM APPLICATION

PROJECT BASED LEARNING FROM FWD

Abstract

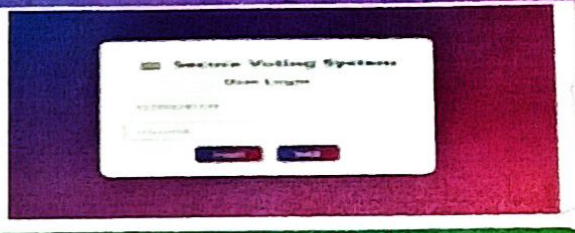
The Advanced Secure Voting System is a Java-based online voting application that ensures secure, reliable, and transparent elections. It uses strong authentication and encrypted storage to prevent unauthorized access and duplicate voting, while providing accurate vote counting and improving overall efficiency.

System Architecture

CO-WISE IMPLEMENTATION

CO1 Internet Fundamentals, HTML & Introductory CSS

- Responsive Dashboard Design
- Semantic HTML
- CSS Flexbox/Layout
- Form Styling



CO2 JavaScript Programming Essentials

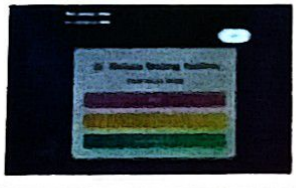
- User Identity
- Details
- Working UI

CO4 JavaScript Interactivity, DOM & Events

- Performance
- Data
- Login

CO4 JavaScript Interactivity, DOM & Events

- Information
- Stores Data
- Quick Response



CO4 Advanced Web Development & Deployment

- Multiple data
- Input
- Easy to use

Conclusion & Future Scope

- This project demonstrates **core web** development concepts, like responsive UI, form handling, interactivity, and backend integrations. In future, the system can be expanded seamlessly and enhanced with AI-driven recommendations.

VIRTUAL VOTING SYSTEM
